

EMBRACING THE POWER OF AI FOR ESL EDUCATION

Olena Zemliakova, Olena Shakhmatova

National Technical University "Kharkiv Polytechnic Institute", Kharkiv

Artificial intelligence (AI) has rapidly developed in recent years, and it is now being used in various industries and fields worldwide. AI technology such as ChatGPT for instance can facilitate language learning, provide personalized learning experiences, and enhance language proficiency through interactive and engaging activities. In addition, AI can help students to practice their language skills in a safe and low-pressure environment, making it an increasingly popular tool in language teaching. ESL teachers especially those in technical universities can use ChatGPT in a number of ways:

Writing prompts: Teachers can use ChatGPT to generate writing prompts for their students. They can input a topic, and ChatGPT can suggest various prompts that the students can use to write essays or stories.

Writing feedback: ChatGPT can be used to analyze student writing and provide feedback on grammar, vocabulary, and sentence structure. This can save teachers time and help students improve their writing skills.

Personalized learning: By inputting specific language concepts, ChatGPT can generate customized language learning materials such as quizzes, worksheets, and exercises that cater to individual students' needs and skill levels.

Text analysis: Teachers can use ChatGPT to analyze complex texts, identify key language patterns, and help students understand difficult concepts. This can also help students improve their own writing by exposing them to effective language use.

Conversational practice: ChatGPT can be used to create AI-powered chatbots that simulate conversational interactions with students. This can help students practice their speaking and listening skills in a safe and low-pressure environment.

Vocabulary exercises: Teachers can input a list of vocabulary words into ChatGPT, and it can generate exercises for students to practice using those words in context. For example, ChatGPT could create fill-in-the-blank sentences or matching exercises. **Grammar exercises:** ChatGPT can also be used to create grammar exercises for students. Teachers can input a specific grammar rule, and ChatGPT can generate exercises for students to practice that rule. For example, ChatGPT could create exercises for practicing verb tenses or sentence structure.

Reading comprehension exercises: AI can analyze a text and generate reading comprehension exercises for students. For example, it could create multiple-choice questions or fill-in-the-blank exercises that test students' understanding of the text.

In conclusion, AI can offer ESL teachers a range of tools and resources that can enhance their professional activities and provide more personalized learning experiences for their students.
